How should we assess telehealth benefits for cochlear implant services?

Dr Cathy Sucher and Assoc Prof Mel Ferguson are investigating ways to assess if the delivery of cochlear implant services through telehealth is equivalent to the gold-standard face-to-face clinical model of care.

This study aims to develop a core set of outcome measures to help maximise telehealth's benefits and ensure optimal and personalised care for cochlear implant users.

We invite all clinicians working with adult cochlear implant users, professionals involved in cochlear implant service provision, and adult cochlear implant users to share their opinions on what areas should be assessed and the measures used to assess cochlear implant outcomes and services.

You will be asked to complete up to three 20-minute online surveys.
